

## This is F\*cking Scary

Yeah, ladies and gentlemen. >> Yeah, ladies and gentlemen, I just got to say that we are officially cooked, man. And before I go any further, I just want to say I do have a bit of a sore throat, so sorry if my voice sounds weird right now. Apologies. You know, sometimes we do get a little sick. But guys, this is something that I've been seeing within the last 48 hours going viral all over the internet. And this is some software made by AI, specifically the Cling AI platform. And as you can see, this man, the technology is so crazy. So here you have the user using the AI, right? He's here in the little box right here. And he's essentially using the AI to kind of get AI constructed models of any celebrity for that matter, but specifically in this case, the actors from Stranger Things. So, here you can see uh what's it? Billy Bobby Brown or Millie, sorry. And you can see the level of detail from Cling AI trying to replicate the faces of these actors. It's just genuinely scary, man. I think from this day on forth, there's nothing you can really trust on the internet anymore. And the uploader of this video said, "Forget everything you knew about video creation. This type of content will become increasingly common in 2026. The difference is who understands the process and comes out ahead." And I just got to say, yo, holy Listen, I was already a skeptic to begin with with the likes of certain individuals who knew how to CGI and use Photoshop to manipulate and trick people into believing things that are not true. I was already a skeptic when it came to blackmail and people using software to plant people in places that they were never in. People using, you know, Photoshop to digitally alter certain post to insert words that were never there or typed by the person who posted it. But now, ladies and gentlemen, I think we are truly And of course, people in the comments are saying, "I swear I'm scared." Another person said, "I like AI, but this can have negative consequences." And by the way, guys, do you think a regular person like this in the public is the first to come across this technology? Do you really believe this technology is all of a sudden coming out of nowhere and that the military, intelligence agencies, and certain shadow organizations didn't have access to this years ago before we even had access to it ourselves? I mean, ladies and gentlemen, understand by the time it gets to the public sphere, the public space. Oftent times, not always, it'll likely already be old technology. Yeah, this is scary. And you want to know who I feel bad for the most? Is pretty much all the old people out there. Especially the boomers. What are the boomers like 70 plus years old at this point in time? Like these people, they're done. They're finished. Especially the sugar daddies of that generation. They're cooked. It's

all over for them anytime, bro. Anything that can be produced online, FaceTime, Snapchat, Instagram, Facebook, they're not going to be able to distinguish fact from fiction. Whole community is going to be oneshotted like Hiroshima Nagasaki. AI is about to run through the whole generation like the black plague of the 1400s. Nigerian and Indian scammers about to have a field day scamming old ass horny old dudes for their entire life savings, retirement, and 401ks by doing exactly what this guy is doing on screen. Like, it's pretty much over. Honestly, if you have an elder or senior citizen parent out there, grandparent, please just keep them offline for the rest of eternity. It's over. And of course, the top comment says, "Indian guys going crazy for this." Yo. Yo, the whole country of India is about to come up majorly off of this. Someone else said, "What will of models do now?" That is a good question. Pretty much at this point in time, they're damn near indistinguishable. Ash says, "We're going to see a societalwide movement towards the imperfections to verify it's human." Hey, and when that happens, AI is going to try to replicate those imperfections, too. Anie said, "What in the world? Can you stream with this, too? Like a virtual camera?" Not yet, but it's coming. So, not only are Only Fans models about to go out of business because of this, but VTubers, too, pretty much cooked. Or maybe not. Maybe they're just going to upgrade to lifelike human models to replace the furry little anime girl cosplays they like to do online. There's one that also scared the hell out of me. So, is it any good? >> Bro, tell me this does not look like an actual real girl with makeup on. Like, genuinely, the level of detail that this software is able to produce is again, the whole Boomer Sugar Daddy community is about to get one shot like the asteroid did to the dinosaurs 70 million years ago. The amount of fraud claims, scam claims, retirement fund fraud claims we're about to see pop up within the next 2 years will be incredible. It'll pretty much make those Nigerian email scammers of kings and queens in Nigeria who lost access to a bank account with \$10 million in it if you know you know look like child's play. And apparently back in the day a lot of old people fell for those scams as obvious as they were to us. So imagine that a simple scam like that people falling for in comparison to this new age technology to where if anybody has any face online ever uploaded they can pretty much take that face your granddaughter your daughter your uncle your cousin your father overlay it into this cling software digitally model it and sync it with your face via their camera pretend as if they're kidnapped or broken down on the side of the road or overseas and need help. You send them money to some undescript location with a checking savings account number. They they're crying. They're they're in distress. They they act like it's a life ordeath situation and then that old person just so

happens to end up sending them thousands of dollars. Like the amount of scams you can do with this is pretty much endless at this point. And by the way, for those of you who don't believe that this is AI, it literally is. You can see the imperfections here and near her her earlobe. Also, her hair is a little too firm as you can see here. I don't think Yeah, the hair unless there's like moose. Yeah. No, a bit too firm. And her her, you know, facial movements are just a little too uncanny like things. Ah, you know, it just seems a bit weird. This would be the facial movements of somebody who's incredibly high, but obviously the average person is not going to be doing all this like analytical observations of what they're actually seeing on screen to see if it's AI or not. >> It's honestly kind of crazy that with just 16 gigs of VRAM, you can already generate like a 15-second HD video. Yeah, it's not perfect, but look at the motion and the lip sync. It's actually really well done, >> bro. Yo, guys. And then, as you can see here, I'm moving it slowly, right? Like look at this motion blur. Look at the the AI models. Like the acne, the wrinkles, the I mean it still looks a little uncanny. So this isn't as good as the beginning, right? This is like way better here. And you had better examples here. So I guess depending on the user who's inputting the uh what do we call it? The prompts and the level of quality for the models I I suppose they download will determine how realistic it looks in the final product. But you pretty much get the point. Also, someone says here, here's how to do this in 2 minutes. Go to Cling AI. So, that's the platform. Use Cling Motion Control. I'm not sure if it's paid or not. Upload video that you want to mimic. So, that could be anything online. Add character image and that's it. The amount of use cases for this are insane if you think about it. So, yeah. And this is obviously they're selling the software 10% off, so they may give you a free trial or not. Um, so yeah, at this point in time, I've never been happier that my face isn't really out there. Like I'm incredibly grateful for that. But again, it's just like eventually my face will be out there and I will become a victim as well. Technically, my face is already out there if you know where to look for it. But yeah, I saw the natural progression of this happening over the years. And I'm sure I've made videos about this that you guys have seen if you've, you know, been a longtime viewer. And this is just the the natural progression of this technology. This was the logical conclusion. And and it's only going to get better. It's only going to get better. the uncanny valley features and the, you know, the weird quirks that AI make, they're going to get steamed. They're going to get perfected. They're going to, you know, eventually become wrinkle-free. And when that happens, hey, you quite literally will not be able to trust anything on your own online without some type of software to detect if it's AI or not. And unfortunately, these are the times we're living in. I I man, it sucks. It

sucks. Culture, like society really did peak, I would say maybe '9s, 2000s before social media and all this took over. But hey man, pray for us. Pray for Gen Z. Pray for millennials. Pray for uh AI Gen Alpha. And pray for Beta cuz this is what we're going to have to live through. You know, as Jen, everybody else who are older than that generation are on the way out. We are unfortunately going to have to live through this mess. And yikes.
